

Dafny Cheatsheet

Imperative and OO

Keyword(s)	What it does	Snippet
var	declares variables	<code>var nish: int; var m := 5; /* inferred type */ var i: int, j: nat; var x, y, z: bool := 1, 2, true;</code>
:=	assignment	<code>z := false; x, y := x+y, x-y; /* parallel assignment */</code>
if..else	conditional statement	<code>if z { x := x + 1; } /* braces are */ else { y := y - 1; } /* mandatory */</code>
if..then ..else	conditional expression	<code>m := if x < y then x else y;</code>
while forall	loops	<code>while x > y { x := x - y; } forall i 0 <= i < m { Foo(i); }</code>
method returns	subroutines	<code>/* Without a return value */ method Hello() { print "Hello Dafny"; } /* With a return value */ method Norm2(x: real, y: real) returns (z: real) /* return values */ /* must be named */ { z := x * x + y * y; } /* Multiple return values */ method Prod(x: int) returns (dbl: int, trpl: int) { dbl, trpl := x * 2, x * 3; }</code>
class	object classes	<code>class Point /* classes contain */ { /* variables and methods */ var x: real, y: real method Dist2(that: Point) returns (z: real) requires that != null { z := Norm2(x - that.x, y - that.y); } }</code>
array	typed arrays	<code>var a := new bool[2]; a[0], a[1] := true, false; method Find(a: array<int>, v: int) returns (index: int)</code>

Specification

Keyword(s)	What it does	Snippet
requires	precondition	<pre>method Rot90(p: Point) returns (q: Point) requires p != null { q := new Point; q.x, q.y := -p.y, p.x; }</pre>
ensures	postcondition	<pre>method max(a: nat, b: nat) returns (m: nat) ensures m >= a /* can have as many */ ensures m >= b /* as you like */ { if a > b { m := a; } else { m := b; } }</pre>
assert assume	inline propositions	<pre>assume x > 1; assert 2 * x + x / x > 3;</pre>
! && ==> <== <==>	logical connectives	<pre>assume (z !z) && x > y; assert j < a.Length ==> a[j]*a[j] >= 0; assert !(a && b) <==> !a !b;</pre>
forall exists	logical quantifiers	<pre>assume forall n: nat :: n >= 0; assert forall k :: k + 1 > k; /* inferred k:int */</pre>
function predicate	pure definitions	<pre>function min(a: nat, b: nat): nat { /* body must be an expression */ if a < b then a else b } predicate win(a: array<int>, j: int) requires a != null { /* just like function(...): bool */ 0 <= j < a.Length }</pre>
modifies	framing (for methods)	<pre>method Reverse(a: array<int>)/* not allowed to */ modifies a /* assign to elements of "a" otherwise */</pre>
reads	framing (for functions)	<pre>predicate Sorted(a: array<int>)/* not allowed to */ reads a /* refer to "a[_]" otherwise */</pre>
invariant	loop invariants	<pre>i := 0; while i < a.Length invariant 0 <= i <= a.Length invariant forall k :: 0 <= k < i ==> a[k] == 0 { a[i], i := 0, i + 1; } assert forall k :: 0 <= k < a.Length ==> a[k] == 0;</pre>
